Lab 4

Ex. 2 README

- largest_and_smallest function gets 3 numbers, and returns the biggest one and the smaller one.

- Which inputs did you choose to check this function?

- Why did you choose these values?

Let’s Play Nim!

- Your task is to build a program which simulates the Nim game.
- Instructions are simple: two players compete for who takes the last match (גפרור)
- There are number of rows of matches
- In each turn, the current player chooses a row number, and how many matches to take from it (at least 1)
- The player who takes the last match wins the game

Let’s split this big task into small tasks

1) Initialize the board
2) Do until the board is empty:
    - Get the next player
    - Print the board
    - Get input
        - Check validity
    - Update board
3) Determine who wins

Break it up into functions

1) init_board()
2) get_next_player()
3) print_board()
4) is_board_empty()
5) get input()
6) check_row_number_validity()
7) check_amount_taken()
8) update_board()

Then call the function to run the program: run_game()
